PUBLISHING SYSTEM / V1.0

Kiran Kindle Craft System

AI-assisted coloring books from a single shared project folder

For Antigravity, Cursor, Claude, Codex and ChatGPT. Plan original scenes, manage human art approvals, build print PDFs, and prepare an Amazon KDP paperback listing.

Included: Source code, product templates, 50 animal-scene prompts, multi-agent instructions, research and QA checklists, pricing model, KDP account guidance and Gumroad roadmap.

Not included: 50 finished and approved art files, publishing account access, API/image credits, guaranteed KDP approval or sales, or an automatic uploader.

Stage	Output
1 Research	Dated competitor evidence and original concept
2 Plan	50 distinct prompts and project metadata
3 Illustrate	50 human-reviewed, rights-cleared PNGs
4 Package	52-page interior PDF and full-wrap cover PDF
5 Publish	Print preview, proof, KDP upload and launch

Scope: A KDP **paperback coloring-book** toolkit, not a Kindle eBook generator or autopublisher. Every release requires human judgment, image rights verification and a physical proof.

The included Animals starter remains BLOCKED until artwork and explicit human approvals exist.

1 Install and create a theme

Extract **Kiran_Kindle_Craft_System_v1.zip**. Open a terminal in the extracted **kiran-kindle-craft-system** folder, then run:

```
python -m pip install -r requirements.txt
python scripts/kiran.py new --theme birds --slug happy-little-birds \
  --title "Happy Little Birds" --count 50
```

Built-in themes include **animals, birds, ocean** and **dinosaurs**. A custom theme can be refined by an AI assistant. The bundled **little-animal-adventures** project already includes 50 illustrated-scene briefs.

2 Switch agents without losing context

Every assistant should read **AGENTS.md**, **rules/PUBLISHING_POLICY.md**, the active project **HANDOFF.md**, and then its **project.json**, **scenes.json** and **metadata.json**. Cursor uses its rule file; Claude, Codex and Antigravity have entry instructions. Update HANDOFF.md before switching tools.

3 Create and review illustrations

Use your available approved image-generation tools to produce original art in batches of five. Save **assets/art/001.png** through **050.png**. Target at least 300 effective DPI at placement size (approximately 2550 x 3300 pixels for full-page art). Keep bold black outlines, white spaces, varied actions, child-safe compositions and no unexpected text.

```
python scripts/kiran.py contact --project little-animal-adventures
```

Review all illustrations and copyright/trademark risks personally. Only a human may set each scene's **approved** and **rights_checked** flags. An optional separate color cover image belongs in **assets/cover/front_art.png**. The command-line scripts do not include an image-generation API.

4 Validate and build

After all illustrations exist and every required approval is recorded, run:

```
python scripts/kiran.py status --project little-animal-adventures
python scripts/kiran.py validate --project little-animal-adventures
python scripts/kiran.py build --project little-animal-adventures
```

Validation checks file presence, minimum image dimensions/effective DPI, duplicate bytes, specifications, metadata and human gates. It produces **reviews/automated_qa.json**. Building produces the interior PDF, one-piece wrap cover PDF, listing entry text, dimensions and manifest.

Automated checks do **not** establish image originality, legal rights, print quality or Amazon approval. Inspect every page and compare cover measurements against the official KDP cover template.

5 Create and configure your KDP account

At **kdp.amazon.com**, sign in and complete identity, contact, bank and tax setup directly on Amazon. This toolkit must never receive banking details, tax identifiers, OTPs, passwords or scanned IDs.

On your Bookshelf, create a **Paperback**. Match the title, subtitle and author to your finished cover. Provide an accurate description, up to seven keywords and categories that genuinely exist in KDP's current picker. The sample settings are **black ink, white paper, 8.5 x 11 in, no bleed**. Select the appropriate ISBN option and accurately disclose AI-generated images.

Upload both PDFs, run Print Previewer, order and inspect a physical proof, verify live royalty calculations, then publish manually. Coloring books are generally ineligible for Expanded Distribution. Verify all policies at the time of publication.

KDP guidance: kdp.amazon.com/en_US/help/topic/G200620010 and kdp.amazon.com/en_US/help/topic/G201857950.

6 Research and pricing discipline

Before launching, record 12-20 current competing paperback listings with dated URLs, page counts, prices, authors and positioning. Never invent sales figures or treat old bestseller lists as live rankings.

The original October 2026 toolkit used a sample **$2.84** printing cost for a 52-page black-ink large-trim paperback on Amazon.com. At a hypothetical **$9.99** price, the estimate was **$3.15 royalty per copy** before taxes, ads or creative costs. These are historical modeling inputs, **not a guaranteed or live quote**. Verify actual print cost, price tiers, fees and reporting in KDP.

At that hypothetical royalty, 100 copies would yield about $315 before expenses and taxes. Royalties generally do not arrive immediately; check the actual payout schedule.

7 Later: package a Gumroad creator toolkit

First publish and validate one actual book. Then prepare reusable code, polished licensed demonstrations, templates, a tutorial, changelog and candid limitations. The earlier toolkit floated **$19 starter / $49 creator** as test pricing hypotheses, not established market prices.

Do not resell third-party art or proprietary fonts. Recheck Gumroad fees and commerce policy before offering this toolkit for sale. See gumroad.com/help/article/66-gumroads-fees.

Safeguards

Avoid borrowing money for this experiment, repetitive low-quality book flooding, automatically advancing manual approval flags, unlicensed characters or misleading claims. Keep the starter BLOCKED until finished artwork and human clearance exist.

Next step: open **AGENTS.md** and **products/little-animal-adventures/HANDOFF.md**, then run the **status** command to see what remains.
